# Create a Power BI report for Power BI Report Server

You can store and manage Power BI reports on premises in the Power BI Report Server web portal, just as you can store Power BI reports in the cloud in the Power BI service. You create and edit reports in Power BI Desktop, and publish them to the web portal. Then report readers in your organization can view them in a browser or in a Power BI mobile app on a mobile device.

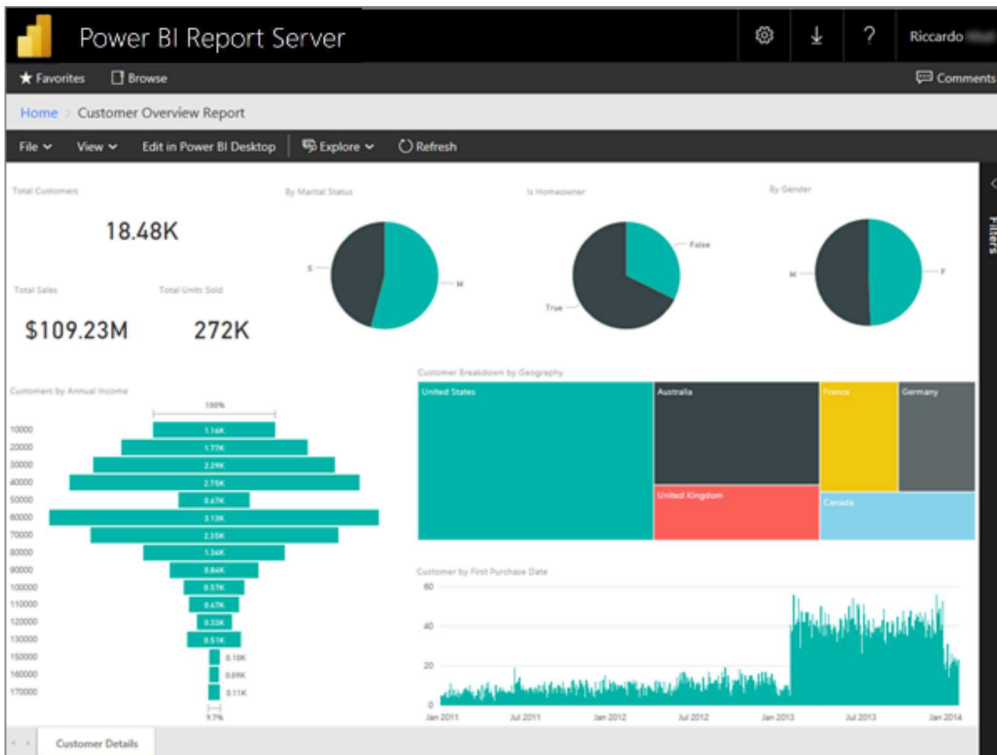

If you've already created Power BI reports in Power BI Desktop, then you're almost ready to create Power BI reports for Power BI Report Server. We recommend installing the version of Power BI Desktop for Power BI Report Server so you know the server and the app are always in sync. You can have both versions of Power BI Desktop on the same computer.

When your report is ready, you save it to the Power BI Report Server.

1. On the **File** menu, select **Save as** > **Power BI Report Server**.
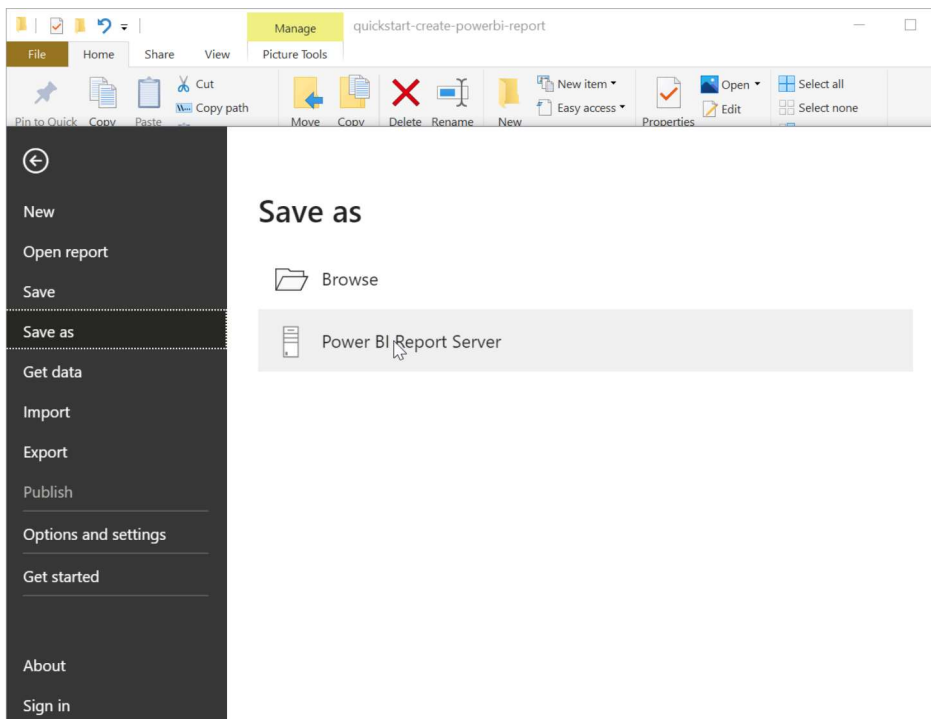

2. Now you can view it in the web portal.
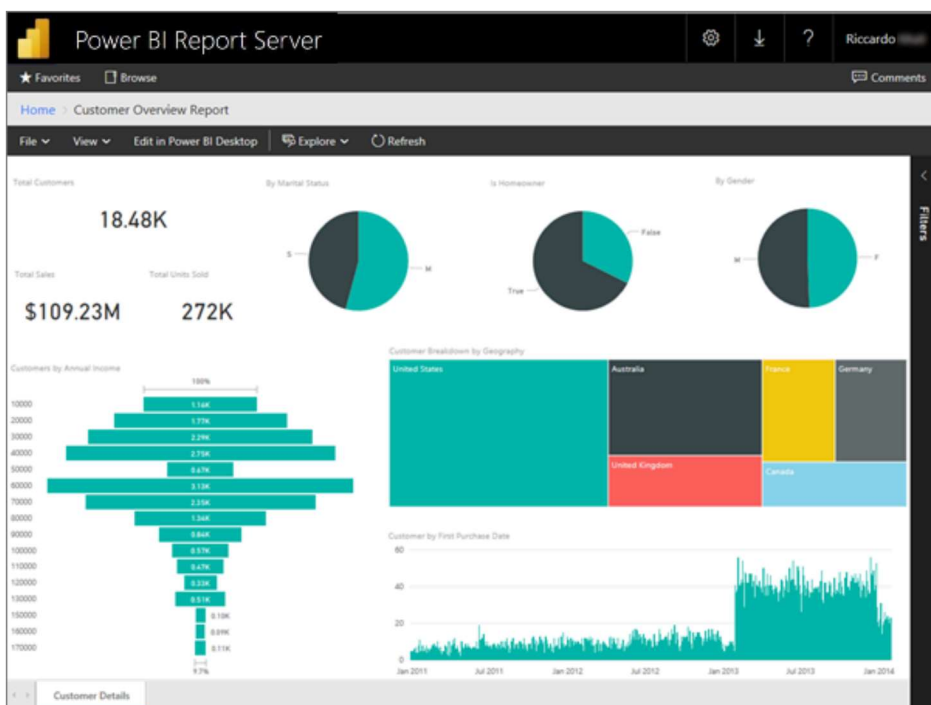

Note! If you choose to edit the report in the future, the report data you see in the desktop will always be the cached data from when the report was initially created. To view the latest data when editing the report, you must refresh the data in your Power BI Desktop application.
